

DISABLING BIBLIOGRAPHY

All the university, graduated professionals with the tools gave us and we were convinced about the infallibility of their treatments.

“If it is published in a book and it was given at university, it must be truth”

But day by day we have to experiment those treatments in patients and today I want to explain the **use of ANALGESICS, NSAIDS and CORTICOIDS in viral cases.**

Since I was a student, it was known that the corticoids low the defenses and that and aspirin could kill the cats but it could not kill the dogs. However, nothing was said about the NSAD`s.

Through a simple observation of the patients along many years of practice as a professional, and after arguing with the doctor Ivanov Castellanos, I was certain that **something was wrong in the use of these medications in the viral treatment.**

This made me appeal to the bibliography about these topics and I arrive to the conclusion that, in the same way that using atropine and novalgin every 6 hours in a parvo treatment was very common during a long time, the 99% of the dogs treated die. Any treatment which didn`t use these recommended poisons in the viral treatments also IMPROVE THE STADISTIC.

For example, the use of xylazine on parvo improved notably the survival of puppies. Today, we don`t use it anymore because we attack the viral in incubation period with Oxytetracycline and some other immunostimulant.

These reflections came to me after doing a tracing with more than 100 cases of patients with Distemper which arrived to my clinic previously medicated with NSAID`s.

The CONCLUSION of this was that **the NSAID`s low the defenses diminishing the levels of histamine in blood, they open the blood-brain barrier and affects the myelin sheaths, taking the patients to an unbearable pain (nervous phase of Distemper) and it obligates to sacrifice the patient. NOTHING IS MORE MISTAKEN FOR TREATING A VIRAL CASE.**

In summary, the study of the consequences of **THE TREATMENT OF PUPPIES PREMEDITATED WITH NSAID`S, EV VACCINE OR WITH CORTICOIDS**, make me affirm without any doubt that this treatment published and studied as an effective “recipe” for all of us, **DOESN`T SAVE PATIENTS, ON THE CONTRARY: IT KILLS THEM WITH AN INDESCRIBABLE PAIN.**

Therefore I ask the readers to spread these ideas, with the propose of ALERT the veterinary community about this DISABLING TREATMENT that even today it circulates as a revealed truth, in an updated bibliography and in different languages, without any of us (veterinarians) raising the voice about it.

In particular I would like the professors of universities which participate in this forum to alert their students about this topic, prepare and capacitate them in an efficient viral treatment and promote the curiosity and the critical spirit of the future professionals, avoiding their students to graduate by repeating formulas which send their patients to a painful death.

I send you a hug, and I hope this text will be useful.
